

Task:

Implement a user registration page with an appropriate styling that takes the following details from the user:

- Email (mandatory)
- Password (mandatory, min of 8 characters, must be a combination of uppercase letter, lowercase letter and a number)
- Name (optional)
- Postcode (optional)

Implement an API in PHP that takes in the user details mentioned above and persists in local memory.

The PHP service should expose the endpoints to return the details of all the registered users and a specific user based on some key.

Notes:

- Include clear instructions about how to run the application for testing purpose
- Please ensure that your solution is properly tested and is of production quality
- You can either share a repository link with the solution or send a zip file
- Please document any relevant information or assumptions you make along the way
- If saving in a repository, please keep the commits small and frequent
